| 14. Free Radical Substitution Problem - Predict Possible Products, How Much, Stereochemistry and Provide a Mechanism For Major Product | 30 |  |
| Total | 376 |  |

Premidterm material $=188$
Postmidterm material $=188$
This is a long exam. It has been designed so that no one question will make or break you. The best strategy is to work steadily, starting with those problems you understand best. Make sure you show all of your work. Draw in any lone pairs of electrons, formal charge and curved arrows to show electron movement where appropriate. Do your best to show me what you know in the time available.
"The limits of the impossible can only be defined by going beyond them...into the impossible." - Arthur Clark

1. Provide an acceptable name for the following molecule. (30 pts)

2. Use the formula $\mathrm{C}_{5} \mathrm{H}_{11} \mathrm{NO}$ to draw examples for each type of isomerism indicated. This will require that you draw at least two structures to show these differences. What is the degree of unsaturation? (25 pts)

|  |  |  |
| :---: | :---: | :---: |
| skeletal isomers |  |  |
|  |  |  |
| positional isomers |  |  |
| functional group isomers |  |  |
|  |  |  |

3. Draw all possible chair conformations of trans-1- isopropyl-2-methylcyclohexane. Make the left most ring carbon C1 and number towards the front. Show all axial and equatorial groups in the first chair. Draw the more stable conformation first. Provide a reason for your answer. Draw a Newman projection of the least stable conformation using the $\mathrm{C}_{2} \rightarrow \mathrm{C}_{1}$ and $\mathrm{C}_{4} \rightarrow \mathrm{C}_{5}$ bonds to sight along. Point out any substituent gauche interactions shown in your Newman projection. If the axial energy of an isopropyl group is $2.1 \mathrm{kcal} / \mathrm{mole}$ and the axial energy of an methyl group is $1.7 \mathrm{kcal} /$ mole and a isopropyl$/$ methyl gauche interaction is $1.1 \mathrm{kcal} / \mathrm{mole}$, what is the ratio of the two conformations at equilibrium? Show your work. Sketch an energy diagram that shows how the energy changes (lower to higher) with the conformational changes and estimate the ratio of the two conformations at equilibrium. ( 30 pts )
a.

$$
\begin{aligned}
& \mathrm{K}=10 \frac{-\Delta \mathrm{G}}{2.3 \mathrm{RT}} \\
& \mathrm{R}=2 \mathrm{cal} / \mathrm{mol}-\mathrm{K} \\
& \mathrm{~T}=300 \mathrm{~K}
\end{aligned}
$$

(15 pts)
b. Newman projection ( $\mathrm{C}_{2} \rightarrow \mathrm{C}_{1}$ and $\mathrm{C}_{4} \rightarrow \mathrm{C}_{5}$ ) - least stable, point out any gauche interactions with the substituent(s)
c. Energy diagram (lower to higher) and relative percents ( $\mathrm{K}_{\mathrm{eq}}=$ ?) ( 5 pts )
d. Calculate an approximate $\Delta \mathrm{H}$ difference between the two conformations. Use that value to estimate a $\mathrm{K}_{\mathrm{eq}}$. (Assume $\mathrm{R}=2 \mathrm{cal} / \mathrm{mol}-\mathrm{K}$ and $\mathrm{T}=300 \mathrm{~K}$.) Use energy values provided in the box. Show your work. ( 5 pts )

[^0]$\Delta \mathrm{H} \approx$
$\mathrm{K}_{\mathrm{eq}} \approx$
4. Use a Newman projection of the $\mathrm{C} 4 \rightarrow \mathrm{C} 3$ bond of $2,2,5$-trimethyl-3-ethylhexane to show the most stable conformation first.

Rotate through all of the eclipsed and staggered conformations. Using the energy values provided in the table below, calculate the relative energies of the different conformations. Plot the changes in energy in the graph diagram provided. Calculate a ratio of least stable to most stable based on $\Delta H$ values. Hint: Draw a 2D structure first and "bold" the bond viewed in your Newman projection, then decide your line of sight. (25 pts)

> 2D structure (3 pts)

| Approximate Eclipsing Energy Values (kcal/mole) Some were estimated by me. |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | H | Me | Et | i-Pr | t-Bu | Ph | Br |

$\Delta \mathrm{H}^{0}=$

$\mathrm{K}_{\text {calculation }}$ (4 pts)
5. Use the following set of Fischer projections to answer each of the questions below by circling the appropriate letter(s) or letter combination(s). Hint: Redraw the Fischer projections with the longest carbon chain in the vertical direction and having similar atoms in the top and bottom portion. Classify all chiral centers in the first structure as R or S absolute configuration. ( 30 pts )

(3 pts) A

B

C

D

E
a. Which are optically active?
A B C D E
b. Which are meso?
c. Which is not an isomer with the others?
d. Which pairs are enantiomers?
$\begin{array}{ccccc}\text { A } & \mathrm{B} & \mathrm{C} & \mathrm{D} & \mathrm{E} \\ \mathrm{A} & \mathrm{B} & \mathrm{C} & \mathrm{D} & \mathrm{E}\end{array}$
e. Which pairs are identical?
f. Which pairs are diastereomers?
g. Which pairs, when mixed in equal amounts will not rotate plane polarized light?
h. Draw any stereoisomers of 2,4-diamino-3-fluorohexane as Fischer projections, which are not shown above. If there are none, indicate this. (5 pts)
i. Taxol was isolated from the slow growing Pacific Yew tree in 1971 and developed into an important anti-cancer drug grown in cell cultures. Circle all of the chiral centers. How many stereoisomers are possible? Show work. (5 pts)

Number chiral centers $=$ $\qquad$

Possible stereoisomers $=$ $\qquad$
6. Draw two additional "better" 2D resonance structures of the given structure. Assume all nonhydrogen atoms have full octets except for + carbon. Add in any necessary lone pairs and use proper curved arrows. Which structure(s) is(are) best and why? Draw a 3D structure for the given resonance structure. Show bonds in front of the page as wedges, bonds in back of the page as dashed lines and bonds in the page as simple lines. Show orbitals for pi bonds and lone pairs along with their electrons. Identify the hybridization, bond angles and descriptive shape for all numbered atoms in the given structure. (30 pts)

Draw a 3D structure of structure A. (15 pts)

Use Lewis structure A to answer this part.
Atom Shape Hybridization Bond Angles \# $\quad$ bonds \# $\pi$ bonds \# lone pairs
7. Indicate all formal charges present in the following structures. Assume all electrons are shown as lines or dots. If other reasonable resonance structures are possible, draw the best other resonance structure using the proper arrow conventions. Indicate which resonance structure is better or if they are equivalent. (18 pts)

$i$
8. a. Only the reactant acid and base are drawn below. Decide which is which and draw a mechanism to show formation of the conjugate base and acid. The two acids have $\mathrm{pK} \mathrm{a}_{\mathrm{a}}$ 's of 15 and $12\left(\mathrm{~K}_{\mathrm{a}}\right.$ values are $10^{-15}$ and $\left.10^{-12}\right)$. Match the $\mathrm{K}_{\mathrm{a}}$ values with the proper acid, write a $\mathrm{K}_{\text {equilibrium }} \operatorname{expression~and~calculate~a~quantitative~} \mathrm{K}_{\text {equibrium }}$ value for the reaction. Show your work. Provide an explanation for your value of $\mathrm{K}_{\text {equilibrium. }}$ ( 15 pts )

$\mathrm{K}_{\text {equilibrium }}=$
b. Use the above pKa values to estimate a pKa for the following acid. Very briefly explain your reasoning. (5 pts)

9. Using arrow-pushing mechanisms, write the expected products from the following reactions and indicate whether the equilibrium lies to the "right" or to the "left". Also, very briefly explain your reasoning. ( 35 pts )
a.

$\rightleftharpoons$
b.

$\rightleftharpoons$
C.

d.

e.

f.

10. Use (2S,3R)-3-bromo-2-deuterioheptane to provide a simple, arrow-pushing mechanism for each of the following reaction conditions (show curved arrows, lone pairs \& formal charge). Fill in the necessary details to clearly indicate any stereochemical features and/or conformational requirements. If reactants are not drawn in the proper orientation to show how the reaction must proceed, then redraw them in a more informative way that shows this. Do not consider carbocation rearrangement possibilities. You can abbreviate (simplify) parts of the molecule that are not part of a reaction. (43 pts)
a. Draw a 2D structure and then a 3D structure of the reacting molecule. A 3D structure will be provided for the cost of the points of this part. (3 pts)

2D structure

(2S,3R)-3-bromo-2-deuterioheptane
b. Show the $\mathrm{S}_{\mathrm{N}}$ reaction (what kind?), indicate the absolute configuration(s) of the $\mathrm{C}_{\alpha}$ center in the product. (7 pts)

c. Show all possible E reaction products (what kind?). Indicate if E, Z or neither. (13 pts)

d. Show the $\mathrm{S}_{\mathrm{N}}$ reaction (what kind?). You can use one intermediate to show all possible mechanistic $\mathrm{S}_{\mathrm{N}}$ possibilities. Indicate absolute configuration(s) of the $\mathrm{C}_{\alpha}$ center in your product(s). (10 pts)

mechanism

configuration in product
e. Redraw the intermediate used in 8d above to show all possible E reaction products. Indicate if the products are $\mathrm{E}, \mathrm{Z}$ or neither. If multiple products are formed between two atoms, you can show all of the possibilities for a single hydrogen atom and just draw the additional possible "E" products. (10 pts)

11. Indicate the major product in the following reactions. Indicate stereochemistry if part of the reaction. Do NOT show mechanisms. (WK = workup = neutralization conditions) (30 pts)

| a. | k. |
| :---: | :---: |
| b. | l |
| C. | m <br> 1. 2 eq. $\mathrm{Br}_{2} / \mathrm{h} \nu$ <br> 2. 3 eq. $\mathrm{NaNR}_{2}$ <br> 3. $\xrightarrow{\mathrm{CH}_{3} \mathrm{Br}}$ |
| d. |  |
| e. |  |
| f. |  |
|  | q $\longrightarrow$ <br> 2. <br> 1 equivalent |
| h |  |
|  | S |
|  |  |

12. Provide all missing arrow-pushing mechanistic details (curved arrows, lone pairs and formal charge) to explain the following transformation. Assume all nonhydrogen atoms have full octets unless a positive charge is written by a carbon atom. (20 pts)
a.

13. workup

14. Provide a complete arrow-pushing mechanism for the following transformations (lone pairs, formal charge and curved arrows). (15 pts)

15. a. Show all possible products when $2 S$-bromobutane is chlorinated with $\mathrm{Cl}_{2} / \mathrm{hv}$ ? Indicate the approximate relative amounts (RA) of each product formed if the relative rates of reaction of a chlorine atom with an $\mathrm{sp}^{3} \mathrm{C}-\mathrm{H}$ bond are: primary $=1$, secondary $=4$, tertiary $=5$ and C-H on a carbon with bromine $=15$. Identify any stereoisomers as enantiomers, diastereomers or meso structures. Show 3D stereochemistry clearly at any chiral centers. ( 15 pts )
b. Provide a complete arrow pushing mechanism to explain formation of the major product from the above reaction (show proper curved arrows, lone pairs as two dots and single electrons as one dot). Clearly label each distinct part of the reaction mechanism. Calculate an overall $\Delta \mathrm{H}$ for each step of your mechanism using the given bond energies. To break a bond is positive energy and to make a bond is negative bond energy. (15 pts)

| $\mathrm{Cl}-\mathrm{Cl}$ | 58 |
| :---: | :---: |
| $\mathrm{H}-\mathrm{Cl}$ | 103 |
| Me C-H | 105 |
| $1^{0} \mathrm{C}-\mathrm{H}$ | 98 |
| $2^{\circ} \mathrm{C}-\mathrm{H}$ | 95 |
| $3^{\circ} \mathrm{C}-\mathrm{H}$ | 92 |
| $\mathrm{Br}-\mathrm{C}-\mathrm{H}$ | 90 |
| $\mathrm{Me}-\mathrm{Cl}$ | 85 |
| $1^{0} \mathrm{C}-\mathrm{Cl}$ | 81 |
| $2^{\text {o }} \mathrm{C}-\mathrm{Cl}$ | 81 |
| $3^{\circ} \mathrm{C}-\mathrm{Cl}$ | 81 |
| $\mathrm{Br}-\mathrm{C}-\mathrm{Cl}$ | 79 |

The important things in life aren't things.

[^0]:    One axial methyl group $=+1.7 \mathrm{kcal} /$ mole,
    Two axial methyl groups, on the same side (cis) $=+5.5 \mathrm{kcal} / \mathrm{mole}$, Three axial methyl groups, on the same side $=+12.9 \mathrm{kcal} /$ mole and
    1,2 gauche methyl groups $=0.8 \mathrm{kcal} / \mathrm{mole}$.
