## Chem 314

Spring, 2007
Midterm Exam
Chem 314

Name $\qquad$

| Problem | Points | Credit |
| :--- | :---: | :---: |
| 1. Nomenclature | 25 |  |
| 2. 2D Lewis structures | 20 |  |
| 3. 3D Structures, Formal Charge \& Resonance | 20 |  |
| 4. Formulas, Functional Groups \& Degrees of <br> Unsaturation | 20 |  |
| 5. Specific Bond Energies or Substitution Patterns <br> and Common Names | 32 |  |
| 6. Thermodynamics, Bond Energies \& Reactions <br> 7. Conformations, Energy (Cylclohexanes \& Chains), <br> Newman Projections | 35 | 15 |
| 8. Physical Properties | 197 |  |
| Total |  |  |

This is a long exam. It has been designed so that no one question will make or break you. You are not expected to completely finish the exam. The best strategy is to work steadily, starting with those problems you understand best. Make sure you show all of your work. Draw in any lone pairs of electrons, formal charge and curved arrows to show electron movement wherever necessary. Only write on the front side of each page. Also, consider the point values in your choice of questions. Do your best to show me what you know in the available time.

1. Provide an acceptable name for the following structure. (25 pts)

2. Draw an acceptable 2D Lewis structure for the following formula. Indicate any formal charges present, all lone pair electrons and completely draw out all atoms (e.g. do not write $\mathrm{CH}_{3}$ ). (20 pts)

3. First, draw three other reasonable 2D resonance structures that delocalize any charge that is present. Include proper arrow conventions. Rank your structures from best (= 1) to poorest. Draw a three-dimensional Lewis structure for the given representation and the best resonance structure among B, C and D. Show $\sigma$ bonds as lines, wedges and dashes and the p orbitals in $\pi$ bonds, as well as any orbitals holding lone pairs. Draw two dots for lone pair and pi bond electrons. Indicate any formal charge present and give the hybridization, bond angles and shape of each labeled nonhydrogen atom (below). Assume that all nonhydrogen atoms have full octets, unless a carbocation is written. ( 30 pts )

B

D
C

Use structure A to fill in the following table.
Hybridization Angles Shape \#o bonds \#mbonds lone pairs
a
b
c
d
e
f
4. Use the given formula to provide an example that includes the listed functional groups. If you draw any other functional groups, identify them as well. Write the matching functional group name by its appearance in the 2D structure. Calculate the degree of unsaturation for your formula. (20 pts)

$$
\mathrm{C}_{15} \mathrm{H}_{16} \mathrm{ClN}_{3} \mathrm{O}_{7}
$$

degree of unsaturation calculation
alkyne, alkene, amine, ester,
ether, ketone, acid, amide, nitrile
5. Match the arrows with the terms. Some arrows may be associated with more than one term. ( 20 pts )

1. methyl $\qquad$ 8. isopropyl $\qquad$ 15. propargyl $\qquad$
2. methylene $\qquad$ 9. isobutyl $\qquad$ 16. phenyl $\qquad$
3. methine $\qquad$ 10. sec-butyl $\qquad$
4. benzyl $\qquad$
5. primary $\qquad$ 11. t-butyl $\qquad$ 18. primary amine $\qquad$
6. secondary $\qquad$ 12. neopentyl $\qquad$ 19. secondary amine $\qquad$
7. tertiary
8. vinyl $\qquad$ 20. tertiary amine $\qquad$
9. quarternary
10. allyl $\qquad$ 21. quaternary ammonium ion

11. a The heat of combustion of hexan-2-one is $-839.2 \mathrm{kcal} / \mathrm{mole}$. Limited heats of formation are provided below. Write an equation for this reaction. Use this information to calculate a heat of formation for hexan-2one. Draw an energy diagram that includes the zero energy reference point and the various other energy values. (15 pts)

Combustion equation:

Show work.

b. Calculate the heat of reaction for the equation below. Clearly show your set up and the appropriate energy values. (4 pts)

c. Calculate the same heat of reaction, as in part $b$, using the average bond energies on the last page. How does this value compare to that of part b? Hint: You may need to solve for a pi bond energy. (7 płs)
d. Find approximate bond energy values for the two carbon-nitrogen bonds pointed out in the following structures using the bond energies in the common substitution patterns table at the end of this exam. Provide a rationale for any observed differences. Draw additional structures, if appropriate to your explanation. (6 pts)

7. a. Draw both chair conformations of cis-1-bromo-2-isopropylcyclohexane and trans-1-bromo-2isopropylcyclohexane. Draw all axial and equatorial groups at substituted positions. Indicate which conformation is more stable in each pair. Which conformation, overall, is most and least stable? Axial energy values are provided on the next page. Assume all gauche interactions are $0.8 \mathrm{kcal} / \mathrm{mole}$. ( 12 pts )
chair $1 \quad \underset{\text { cis }}{\rightleftharpoons}$
chair 1
chair 2
chair 3
chair 4
most stable (1 or 2 ) = $\qquad$ most stable (3 or 4 ) $=$ $\qquad$
most stable overall $(1,2,3,4)=$ $\qquad$ least stable overall $(1,2,3,4)=$ $\qquad$
b. Calculate an approximate $\Delta \mathrm{H}$ difference between the two conformations. Use that value to estimate a Keq. (Assume $R=2 \mathrm{cal} / \mathrm{mol}-\mathrm{K}$ and $\mathrm{T}=300 \mathrm{~K}$.) Use energy values provided in the box. Show your work. ( 6 pts)

$\Delta \mathrm{H} \approx$
$\mathrm{K}_{\mathrm{eq}} \approx$
c. Use the second most stable conformation from part a, and draw a Newman projection using bonds $\mathrm{C}_{1} \rightarrow \mathrm{C}_{2}$ and $\mathrm{C}_{5} \rightarrow \mathrm{C}_{4}$ for your structure (or... $\mathrm{C}_{2} \rightarrow \mathrm{C}_{1}$ and $\mathrm{C}_{4} \rightarrow \mathrm{C}_{5}$ ). Point out any gauche relationships in the branches and/or the ring. (5 pts)
d. Use a Newman projection of the $\mathrm{C} 2 \rightarrow \mathrm{C} 3$ bond of 3-methylbutan-2-ol to show the most stable and least stable conformations. Using the energy values provided, calculate the energy difference between these two conformations. Calculate a Kequilibrium and use it to estimate the ratio between these two conformations at equilibrium. Hint: Draw a 2D structure first and "bold" the bond viewed in your Newman projection. Assume $R=2 \mathrm{cal} / \mathrm{mol}-\mathrm{K}$ and $\mathrm{T}=300 \mathrm{~K}$. (12 pts)

| Eclipsing Energy |  |
| :--- | :---: |
| Values (kcal/mole) |  |$|$| $\mathrm{H} / \mathrm{H}$ | +1.0 |
| :--- | :---: |
| $\mathrm{H} / \mathrm{CH}_{3}$ | +1.3 |
| $\mathrm{CH}_{3} / \mathrm{CH}_{3}$ | +2.5 |
| $\mathrm{H} / \mathrm{OH}$ | +0.7 |
| $\mathrm{CH} / \mathrm{OH}$ | +1.5 |
| any gauche | +0.8 |

Not used on this exam, but consider as a possible question.
d. Acids $A$ and $B$ have different structures, but share a common conjugate base. Draw the curved arrows to show how the proton transfer occurs in each case and explain why the conjugate base is the same for each acid. (10 pts)

Match the arrows with the terms. Some arrows may be associated with more than one term. (20 pts)

1. methyl $\qquad$ 8. isopropyl $\qquad$ 15. propargyl $\qquad$
2. methylene $\qquad$ 9. isobutyl $\qquad$ 16. phenyl $\qquad$
3. methine $\qquad$ 10. sec-butyl $\qquad$ 17. benzyl $\qquad$
4. primary $\qquad$ 11. t-butyl $\qquad$ 18. primary amine $\qquad$
5. secondary $\qquad$ 12. neopentyl $\qquad$ 19. secondary amine $\qquad$
6. tertiary $\qquad$ 13. vinyl $\qquad$ 20. tertiary amine $\qquad$
7. quarternary $\qquad$ 14. allyl $\qquad$ 21. quaternary ammonium ion $\qquad$

8. 

Indicate the bond energy between the two atoms indicated. Use the specific bond energy table provided on the last page. Write the common nomenclature term of each carbon group about the bond energy requested. Draw an arrow to any part of any structure to indicate where a methyl, methylene, methine, primary, secondary, tertiary and quaternary carbon is located. A table of bond energies is provided on the last page ( 15 pts )

indicate bond energy between a-b $\qquad$ common name of fragment "a" $\qquad$ common name of fragment "b" $\qquad$

indicate bond energy between c-d $\qquad$ common name of fragment " c " $\qquad$ common name of fragment "d" $\qquad$
9. Haldol is a potent orally active central nervous system tranquilizer used in the treatment of psychoses. Peak plasma levels, when taken orally, are 2-6 hours (in the aqueous blood). Cell membranes, on the other hand, are composed largely of alkane-like fatty acid chains. A decanoate ester prodrug was prepared to increase Haldol's lifetime in the body. When injected intramuscularly its anti-psychotic activity lasted about 1 month. Provide an explanation for its longer lifetime. (12 pts)

## Chem 314

Spring, 2006
Midterm Exam
Name $\qquad$

| Problem | Points | Credit |

| 7. Physical Properties | 12 |  |

This is a long exam. It has been designed so that no one question will make or break you. You are not expected to completely finish the exam. The best strategy is to work steadily, starting with those problems you understand best. Make sure you show all of your work. Draw in any lone pairs of electrons, formal charge and curved arrows to show electron movement wherever necessary. Also, consider the point values in your choice of questions. Do your best to show me what you know in the available time.

1. high priority group plus lots of lower priority groups, alkene (E/Z), alkyne, complex branches
2. long 2 D structure with lots of functional groups and a little bit of formal charge
3. just like in the example exams, need to know resonance, formal charge, arrow pushing, hybridization details, how to draw 3D shapes
4. need to know functional groups, calculate degree of unsaturation, common nomenclature, specific bond energies
5. work with heat of formation, heat of reaction, use bond energy table, sketch energy diagram
6. need to know how to put substituents on a cyclohexane ring, draw all possible chair conformations, evaluate their energy, do the same for an open chain compound (staggered / eclipsed), use $\Delta H$ to calculate an equilibrium ratio, draw Newman projections for rings and open chains
7. biological explanation using physical properties
